

Appendix A -

I - I.1 – Diagnosis of the 1991 Wave

Scree plot

Below are additional tests specifically related to Factorial Analysis:

I.2 - Diagnosis of the 1997 Wave

Scree plot

Below are additional tests specifically related to Factorial Analysis:

I.3 – Diagnosis of the 2006 Wave

Scree plot

Below are additional tests specifically related to Factorial Analysis:

I.4 – Diagnosis of the 2014 Wave

Scree plot

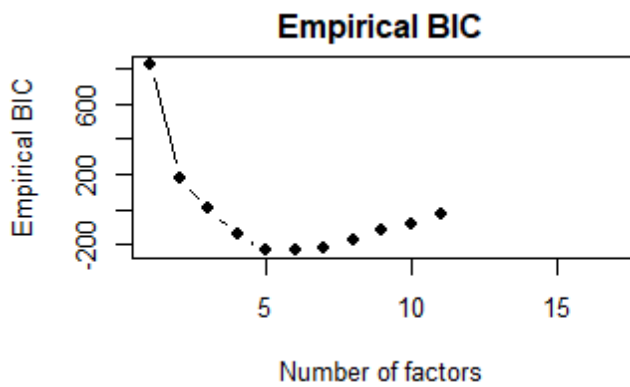

Below are additional tests specifically related to Factorial Analysis:

II.5 – Diagnosis of the 2018 Wave

Below are additional tests specifically related to Factorial Analysis:

II

Factorial analysis with 2 and 3 factors.

VII

Next, we present robustness tests. Initially, in Appendix A.VII, we will present the results of confirmatory factor analysis. In Appendix A.VIII, it will be the turn of the item response theory technique.

VARIABLES USED:
 F120 ABORTION
 E018 MORE RESPECT FOR AUTHORITIES
 F063 IMPORTANCE OF GOD
 G006 NATIONAL PRIDE
 E034 PROGRESSIVE VS CONSERVATIVE
 E035 INCOME EQUITY
 E036 PRIVATE VS PUBLIC ENTERPRISES

The economic division, as seen in the exploratory analysis and item response theory, is still not found. This change is in line with Moreno's description (2019) of shifting from democracy-authoritarianism to fundamentalism-religious.

It's notable that in 1991, the first factor is related to variables E018, G006, and E034, which represent authoritarianism and conservatism. However, starting from 1997, even though the p-value is significant, the only variable with a factor loading > 0.4 alongside F120 (abortion) is F063 (importance of God).

The two-factor solution yields better adjustments in 4 waves, but it results in the subdivision of the fundamentalism factor (Moreno, 2019). Questions unrelated to the dimensions of fundamentalism as used in our study never factor on their own, creating separate factors.

As an additional robustness test, we conducted item response theory (IRT) analyses. The results indicate the same variable configurations grouping together as presented in the following sections. We applied the same models presented in this study using IRT scores and arrived at results consistent with our regressions. These findings will be provided in Appendix A.VIII.

VIII

We replicated the same tests from the exploratory factor analysis using Item Response Theory (IRT). 1991 with one factor and with two factors:

In the 2006 wave, when run with 2 factors, it exceeded 500 iterations. Its use is not considered appropriate according to the literature (Liu and Chalmers, 2018). The two-factor solution yields better adjustments in some waves; however, it leads to the subdivision of the fundamentalism factor (Moreno, 2019). Questions unrelated to the dimensions of fundamentalism as used in our study never factor on their own, creating separate independent factors.

2014 wave with one factor and with two factors:
